

AgSense

Websites: www.agsense.net

What we do: AgSense manufactures hardware and software for remote web based farm management. Our chief applications are monitoring and controlling irrigation pivots, soil moisture monitoring and grain bin monitoring. Customers have the ability to view and control their devices remotely using the web or Android and iPhone apps. Text notifications are sent to your phone to notify you of crucial changes such as power, stuck pivots, cable theft and pressure. Customers also have access to historical data to generate reports.

Our History: AgSense was founded in 2003 by two brothers that farm near Huron, SD using center pivot irrigation. One had an engineering background in telecommunications, and used that knowledge to develop the first AgSense systems for their own pivots. After successful development and testing, they brought in staff to manage the business as well as market and sell the product. The company remained independently owned until August, 2014, at which time Valmont Industries purchased a controlling interest. AgSense remains a 'stand-alone' business, operating as it had prior to that merger and under same management.
